

SaaS-delivered Search for Drupal

The pressure to quickly engage potential customers online is at an all-time high. Acquia Search is a fully managed SaaS offering that integrates seamlessly with Drupal applications. Built on the enterprise-grade Apache Solr search engine, Acquia Search is hosted on Acquia Cloud, a fully redundant infrastructure that ensures search is a highly available feature of your website.

Create Relevant, Engaging Online Experiences

Most online visitors are gone in ten seconds if they don't find what they're looking for. Whether they start with a search term, or explore through navigation, the results need to be delivered in line with today's search functionality expectations. Acquia Search provides industry-leading functionality on our trusted Acquia Cloud platform:

- **Faster searches**—Users can refine their search by tags, date range, content type, and other metadata to quickly target the content that is relevant.
- **Better results**—Users can sort search results, and administrators can tweak the ranking algorithms via an intuitive user interface to adjust which content is returned higher in the search results.
- **More relevant recommendations**—Automatically suggest related content allowing users to discover additional products or information.
- **Dynamic cross-site searches**—Display unified results from all your web properties, including the contents of files attached to your sites.

The Ultimate Drupal Search Solution

- Used by thousands of Acquia customers
- Millions of queries served daily
- Install in minutes
- Control the search experience by customizing results

Making It Easy to Deploy and Scale Search on Drupal Sites

Acquia Search is available on-demand, supported by Acquia Cloud. Site administrators and developers can add Acquia Search to any site in minutes. Install the Acquia Search module, connect to the Acquia Network—and that's it!

- No software and servers to maintain
- No hardware to install
- No Java applications to manage

More Features!

Acquia recently made significant enhancements to Acquia Search. Notable functionality enhancements include:

- **Geospatial Search**—Acquia Search is able to search, sort, and adjust result rankings based on location by using the distance filter, bounding box, or distance function so you can present users with content that is geographically relevant.
- **Multiple Drupal version support**—For sites maintaining both Drupal 6 and Drupal 7 code bases, you can now index content from both versions in the same index. Coming soon...Drupal 8!
- **Multi-entity indexing**—Drupal is great at maintaining different types of content that it calls "Entities." Acquia Search can index all the entities provided by Drupal, such as content types, taxonomy terms, users, comments, commerce products, and more. APIs are exposed to developers to index custom entities and data stored outside of Drupal.
- **Targeted search page creation**—Build additional search pages via an intuitive UI to provide sub-searches of your application's content.
- **Improved attachment search**—Acquia Search now recognizes more file types than ever before: HTML, XML, Microsoft Office documents, rich text, audio, image, and video formats, and more.
- **Search statistics**—Gain insight into how users are interacting with search and which queries aren't producing results. The metrics provided guide site administrators toward configuration modifications that improve the search experience for users.
